

UltraCheck Diagnostic Services **EMPATH™ 2000**

Customers have a number of options that they may choose to fit their specific needs.

- We can collect & analyze the data from your motors
- We can provide data analysis services in our offices of data you have collected
- We can train your personnel to collect and analyze the data

Our data collection is typically done from the Motor Control Center, the equipment must be in operation. Our data collection process takes approximately three minutes. Trending can be performed over time to provide a true picture of the health of the motor. This type of preventative diagnostic testing will help you reduce your overall maintenance costs by allowing you to plan and schedule your work.

At Framatome, we have always been interested in establishing long term relationships with customers. We have numerous partnerships with customers and are always open to unique teaming arrangements. We believe that our equipment and services are of the highest quality and can provide the critical data to help you make the right decisions that affect the operation of your equipment and your plant.
